(57) **ABSTRACT**

Techniques for providing eyewear with electrical compo-
nents are disclosed. The electrical components can provide
electrical technology to eyewear without having to substan-
tially compromise aesthetic design principles of the eye-
wear. The electrical components can be partially or com-
pletely internal to eyewear, such as within an extended
endpiece. The electrical components can also be attached to
the eyewear as an after-market enhancement. The electrical
components can operate independently or together with
other electrical components provided elsewhere. Apparatus
for presenting after-market electrical components are also
disclosed.

CROSS-REFERENCE TO RELATED
APPLICATIONS

This application is a continuation of U.S. patent application Ser. No. 16/127,957, filed Sep. 11, 2018, now U.S. Pat. No. 11,086,147, and entitled “EYEWEAR SUPPORTING ELECTRICAL COMPONENTS AND APPARATUS THEREFOR” which is incorporated herein by reference, which in turn is a continuation of U.S. patent application Ser. No. 14/715,501, filed May 18, 2015, now U.S. Pat. No. 10,330,956, and entitled “EYEWEAR SUPPORTING ELECTRICAL COMPONENTS AND APPARATUS THEREFOR” which is incorporated herein by reference, which in turn is a continuation of U.S. patent application Ser. No. 13/367,346, filed Feb. 6, 2012, now U.S. Pat. No. 9,033,493, and entitled “EYEWEAR SUPPORTING ELECTRICAL COMPONENTS AND APPARATUS THEREFOR” which is incorporated herein by reference, which in turn is a continuation of U.S. patent application Ser. No. 12/462,286, filed Jul. 31, 2009, now U.S. Pat. No. 8,109,629, and entitled “EYEWEAR SUPPORTING ELECTRICAL COMPONENTS AND APPARATUS THEREFOR” which is incorporated herein by reference, which in turn is a continuation of U.S. patent application Ser. No. 11/580,222, filed Oct. 11, 2006, now U.S. Pat. No. 7,581,833, and entitled “EYEWEAR SUPPORTING AFTER-MARKET ELECTRICAL COMPONENTS” which is hereby incorporated herein by reference.

This application and U.S. patent application Ser. No. 11/580,222 references U.S. patent application Ser. No. 11/183,269, filed Jul. 15, 2005, now U.S. Pat. No. 7,922,321, and entitled “EYEGLASSES SUPPORTING AFTER MARKET ELECTRICAL COMPONENTS,” which is hereby incorporated herein by reference, which in turn is a continuation-in-part of U.S. patent application Ser. No. 10/964,011, filed Oct. 12, 2004, now U.S. Pat. No. 7,192,136, and entitled “TETHERED ELECTRICAL COMPONENTS FOR EYEGLASSES” which is hereby incorporated herein by reference, which in turn claims priority to each of: (i) U.S. Provisional Patent Application No. 60/509,631, filed Oct. 9, 2003, and entitled “TETHERED ELECTRICAL COMPONENTS FOR EYEGLASSES,” which is hereby incorporated herein by reference; (ii) U.S. Provisional Patent Application No. 60/527,565, filed Dec. 8, 2003, and entitled “ADAPTABLE COMMUNICATION TECHNIQUES FOR ELECTRONIC DEVICES,” which is hereby incorporated herein by reference; (iii) U.S. Provisional Patent Application No. 60/562,798, filed Apr. 15, 2004, entitled “EYEWEAR WITH ULTRAVIOLET DETECTION SYSTEM,” and which is hereby incorporated herein by reference; (iv) U.S. Provisional Patent Application No. 60/583,169, filed Jun. 26, 2004, entitled “ELECTRICAL COMPONENTS FOR USE WITH EYEWEAR, AND METHODS THEREFOR,” and which is hereby incorporated herein by reference; (v) U.S. Provisional Patent Application No. 60/592,045, filed Jul. 28, 2004, entitled “EYEGLASSES WITH A CLOCK OR OTHER ELECTRICAL COMPONENT,” and which is hereby incorporated herein by reference; and (vi) U.S. Provisional Patent Application No. 60/605,191, filed Aug. 28, 2004, entitled “ELECTRICAL COMPONENTS FOR USE WITH EYEWEAR, AND METHODS THEREFOR,” and which is hereby incorporated herein by reference.

This application and U.S. patent application Ser. No. 11/183,269 also references each of: (i) U.S. Provisional Patent Application No. 60/618,107, filed Oct. 12, 2004, and entitled “TETHERED ELECTRICAL COMPONENTS FOR EYEGLASSES,” which is hereby incorporated herein by reference; (ii) U.S. Provisional Patent Application No. 60/620,238, filed Oct. 18, 2004, entitled “EYEGLASSES WITH HEARING ENHANCED AND OTHER AUDIO SIGNAL-GENERATING CAPABILITIES,” and which is hereby incorporated herein by reference; (iii) U.S. Provisional Patent Application No. 60/647,836, filed Jan. 31, 2005, and entitled “EYEGLASSES WITH HEART RATE MONITOR,” which is hereby incorporated herein by reference; and (iv) U.S. Provisional Patent Application No. 60/647,826, filed Jan. 31, 2005, and entitled “EYEWEAR WITH ELECTRICAL COMPONENTS,” which is hereby incorporated herein by reference.

This application and U.S. patent application Ser. No. 11/580,222 also claims priority to each of: (i) U.S. Provisional Patent Application No. 60/725,999, filed Oct. 11, 2005, and entitled “EYEWEAR SUPPORTING AFTER-MARKET ELECTRICAL COMPONENTS,” which is hereby incorporated herein by reference; (ii) U.S. Provisional Patent Application No. 60/725,896, filed Oct. 11, 2005, and entitled “EYEGLASSES WITH ELECTRICAL COMPONENTS,” which is hereby incorporated herein by reference; (iii) U.S. Provisional Patent Application No. 60/787,850, filed Apr. 1, 2006, and entitled “EYEGLASSES WITH A HEART RATE MONITOR,” which is hereby incorporated herein by reference; and (iv) U.S. Provisional Patent Application No. 60/846,150, filed Sep. 20, 2006, and entitled “EYEGLASSES WITH ACTIVITY MONITORING,” which is hereby incorporated herein by reference.

In addition, this application is related to each of: (i) U.S. patent application Ser. No. 10/822,218, filed Apr. 12, 2004, now U.S. Pat. No. 7,792,552, and entitled “EYEGLASSES FOR WIRELESS COMMUNICATIONS,” which is hereby incorporated herein by reference; (ii) U.S. patent application Ser. No. 11/078,857, filed Mar. 11, 2005, and entitled “RADIATION MONITORING SYSTEM,” which is hereby incorporated herein by reference; (vi) U.S. patent application Ser. No. 11/183,283, filed Jul. 15, 2005, and entitled “EVENT EYEGLASSES,” which is hereby incorporated herein by reference; (vii) U.S. patent application Ser. No. 11/183,262, filed Jul. 15, 2005, now U.S. Pat. No. 7,760,898, and entitled “EYEGLASSES WITH HEARING ENHANCED AND OTHER AUDIO SIGNAL-GENERATING CAPABILITIES,” which is hereby incorporated herein by reference; (viii) U.S. patent application Ser. No. 11/183,256, filed Jul. 15, 2005, now U.S. Pat. No. 7,500,747, and entitled “EYEGLASSES WITH ELECTRICAL COMPONENTS,” which is hereby incorporated herein by reference; (ix) U.S. patent application Ser. No. 11/183,263, filed Jul. 15, 2005, now U.S. Pat. No. 7,380,936, and entitled “EYEGLASSES WITH A CLOCK OR OTHER ELECTRICAL

COMPONENT,” which is hereby incorporated herein by reference; (x) U.S. patent application Ser. No. 11/183,276, filed Jul. 15, 2005, now U.S. Pat. No. 7,255,437, and entitled “EYEGASSES WITH ACTIVITY MONITORING,” which is hereby incorporated herein by reference; and (xi) U.S. patent application Ser. No. 11/546,685, filed Oct. 11, 2006, now U.S. Pat. No. 7,806,525, and entitled “EYEGASSES HAVING A CAMERA”, which is hereby incorporated herein by reference.

BACKGROUND OF THE INVENTION

Traditionally, eyeglasses have not contained or made any use of electrical components. In recent years, attempts to include electrical components within eyeglasses have had limited success. Even incorporating a small electrical component, such as a microphone, into an eyeglass frame may not be a simple task because, for example, of the necessary electrical connections with the electrical component. Clearly, larger scale electrical components would be more difficult to be provided in or attached to eyeglass frames. Many eyeglasses frames tend to be very compact and lightweight and thus may not have a lot of space for electrical components. Moreover, since eyeglass frames are often fashionable items whose designs are important, there are substantial design tradeoffs involved with providing or attaching electrical components to eyeglass frames.

Even if electrical components are provided in an eyeglass frame, the ability to alter or change electrical components is problematic. Conventionally, once an eyeglass frame is manufactured, electrical components embedded in the eyeglass frame may not be removed, nor can additional electrical components be added into the eyeglass frame. Attachment of electrical components to eyeglass frames has not proven to be reliable, design friendly or commercially successful.

Hence, there is a need for improved approaches to facilitate modifications or alterations to electrical components used with eyeglasses.

SUMMARY OF THE INVENTION

Generally speaking, the invention pertains to techniques for providing eyewear with electrical components. The electrical components can provide electrical technology to eyewear (e.g., eyeglasses) without having to substantially compromise aesthetic design principles of the eyewear. Often, the electrical components can be attached to the eyewear as an after-market enhancement. The electrical components can operate independently or together with other electrical components provided elsewhere. Apparatus can also be provided to present after-market electrical components.

One aspect of the invention relates to temple arrangements for use with eyeglasses. According to this aspect, a temple arrangement includes one or more electrical components. The one or more electrical components are attached to or at least partially embedded in the temple arrangement.

Another aspect of the invention relates to a temple adapter for use with eyeglasses. According to this aspect, a temple adapter includes one or more electrical components that are able to be mechanically (and optionally electrically) coupled to a temple (including a temple tip) of the eyeglasses.

Still another aspect of the invention relates to one or more swappable temple portions for a pair of glasses. In one embodiment, a temple has a forward portion and a rearward portion which can removably couple to one another. In one implementation, different rearward portions can be used

with the same forward portion. In other words, the different rearward portions can be swapped with one another. In one implementation, the different rearward portions can offer different electrical components/functionalities to the pair of glasses. For example, the different rearward portions can provide different electrical components/functionalities such as: battery/power, wireless communication, radio, headset, GPS, pedometer, sun sensor, hearing enhancement, image/video capturing, etc. In another embodiment, different forward portions can be used with the same rearward portion.

Yet still another aspect of the invention relates to eyewear having an extended endpiece so as to facilitate placement of one or more electrical components at the extended endpiece. The one or more electrical components can operate independently or together with other electrical components provided elsewhere. For example, other electrical components can be provided in other regions of the frame for the eyewear. In one particular example, the other electrical components can be located in a bridge area of the frame for the eyewear. In such an example, given that the endpiece is extended, the one or more electrical components can be placed at the endpiece and thereby communicate with other electrical components in a front area or the other endpiece without having to communicate through a hinge or connector.

The electrical components can support signal capturing, signal processing, signal transmission, signal display, signal storage and/or power provision. The signals can be, for example, analog or digital signals. The electrical components can, for example, be used to provide audio output and/or audio pick-up. The electrical components may include and/or control one or more sensors to monitor and/or signal the conditions of a user of the eyewear. The electrical components may also include and/or control one or more operation indicators to signal operational status of at least some other electrical components. In addition, the electrical components can be or pertain to a circuit board or module, which includes a plurality of electrical components.

The invention can be implemented in numerous ways, including a method, system, device, apparatus, and a computer readable medium. Several embodiments of the invention are discussed below.

Other aspects and advantages of the invention will become apparent from the following detailed description taken in conjunction with the accompanying drawings which illustrate, by way of example, the principles of the invention.

BRIEF DESCRIPTION OF THE DRAWINGS

The invention will be readily understood by the following detailed description in conjunction with the accompanying drawings, wherein like reference numerals designate like structural elements, and in which:

FIG. 1 is a perspective view of a pair of glasses according to one embodiment of the invention.

FIG. 2 illustrates a diagram of a number of different embodiments of temple arrangements according to the invention.

FIG. 3A is a diagram of a temple arrangement according to one embodiment of the invention.

FIG. 3B is a diagram of a temple cover that at least partially covers a temple (e.g., temple and/or temple tip) according to one embodiment of the invention.

FIG. 3C is a diagram of a fit-over temple that at least partially fits over a temple (e.g., temple and/or temple tip) according to one embodiment of the invention.

5

FIGS. 3D and 3E are diagrams of a temple arrangement according to another embodiment of the invention.

FIGS. 3F-3H are diagrams of exemplary multi-part temples according to different embodiments of the invention.

FIGS. 3I-3K are diagrams of exemplary rearward portions of multi-part temples according to several embodiments of the invention.

FIGS. 3L-3O are diagrams of exemplary forward portions of multi-part temples according to several embodiments of the invention.

FIG. 3P is a diagram of an eyewear products display apparatus according to one embodiment of the invention.

FIG. 4 shows examples of different electrical components according to the invention.

FIG. 5 is a chart that depicts examples of sensors suitable for use according to the invention.

FIG. 6 illustrates a diagram of a number of different embodiments of temple adapters according to the invention.

FIG. 7A is a diagram of a temple adapter according to one embodiment of the invention.

FIG. 7B is a diagram of a temple adapter according to another embodiment of the invention.

FIGS. 8A and 8B are diagrams of a temple adapter according to another embodiment of the invention.

FIG. 9A is a diagram of a temple adapter according to one embodiment of the invention.

FIGS. 9B and 9C are diagrams of a temple adapter according to another embodiment of the invention.

FIG. 9D is a diagram of a temple adapter according to still another embodiment of the invention.

FIGS. 10A-10C are diagrams of a temple having a bone conducting element according to still other embodiments of the invention.

FIG. 11A illustrates a pair of glasses according to one embodiment of the invention.

FIG. 11B illustrates a pair of glasses according to another embodiment of the invention.

FIGS. 12A-12E illustrate a side view of eyeglass frames having an extended endpieces according to several embodiments of the invention.

FIG. 13A illustrates a temple having multiple parts according to one embodiment of the invention.

FIG. 13B illustrates a portion of an eyeglass frame according to one embodiment of the invention.

FIG. 13C illustrates a portion of an eyeglass frame according to another embodiment of the invention.

DETAILED DESCRIPTION OF THE INVENTION

The invention pertains to techniques for providing eyewear with electrical components. The electrical components can provide electrical technology to eyewear (e.g., eyeglasses) without having to substantially compromise aesthetic design principles of the eyewear. Often, the electrical components can be attached to the eyewear as an after-market enhancement. The electrical components can operate independently or together with other electrical components provided elsewhere. Apparatus can also be provided to present after-market electrical components.

One aspect of the invention relates to temple arrangements for use with eyeglasses. According to this aspect, a temple arrangement includes one or more electrical components. The one or more electrical components are attached to or at least partially embedded in the temple arrangement.

6

Another aspect of the invention relates to a temple adapter for use with eyeglasses. According to this aspect, a temple adapter includes one or more electrical components that are able to be mechanically (and optionally electrically) coupled to a temple (including a temple tip) of the eyeglasses.

Still another aspect of the invention relates to one or more swappable temple portions for a pair of glasses. In one aspect, a temple has a forward portion and a rearward portion which can removably couple to one another. In one embodiment, different rearward portions can be used with the same forward portion. In other words, the different rearward portions can be swapped with one another. In one implementation, the different rearward portions can offer different electrical components/functionalities to the pair of glasses. For example, the different rearward portions can provide different electrical components/functionalities such as: battery/power, wireless communication, radio, headset, GPS, pedometer, sun sensor, hearing enhancement, image/video capturing, etc. In another embodiment, different forward portions can be used with the same rearward portion.

The electrical components can support signal capturing, signal processing, signal transmission, signal display, signal storage and/or power provision. The signals can be, for example, analog or digital signals. The electrical components can, for example, be used to provide audio output and/or audio pick-up. The electrical components may include and/or control one or more sensors to monitor and/or signal the conditions of a user of the eyewear. The electrical components may also include and/or control one or more operation indicators to signal operational status of at least some other electrical components. In addition, the electrical components can be or pertain to a circuit board or module, which includes a plurality of electrical components.

Embodiments of different aspects of the invention are discussed below with reference to FIGS. 1-13C. However, those skilled in the art will readily appreciate that the detailed description given herein with respect to these figures is for explanatory purposes as the invention extends beyond these limited embodiments.

FIG. 1 is a perspective view of a pair of glasses 100 according to one embodiment of the invention. The glasses 100 include a frame and a pair of lenses 102. The frame has lens holders 104 that hold the lenses 102 in position. The frame also has a bridge 106. The glasses 100 further include a pair of temples (or arms) 108. The temples 108 are considered part of the frame. As shown in FIG. 1, each of the temples 108 is coupled to one of the lens holders 104 by a hinge 109. In one embodiment, the temples 108 can be removed from the frame (e.g., at the hinge 109).

In addition, temple arrangements 110 are attached to the temples 108. Here, one or both of the temples 108 can include a temple arrangement 110. A temple arrangement 110 can include one or more electrical components 112. In one embodiment, the temple arrangements 110 can be considered separate parts that can be attached to respective temples 108. Once attached, the temple arrangements 110 can be considered part of, or an extension to, the temples 108.

By having one or more electrical components 112 in one or more of the temple arrangements 110, electrical capabilities can be provided to the glasses 100 without burdensome impact to the design of other parts of the frames. Moreover, by providing electrical components in one or more of the temple arrangements 112, electrical capabilities can be added to eyeglasses in an after-market manner. Still further, by replacing temple arrangements, a user could alter the electrical capabilities of his eyeglasses.

In one embodiment, the glasses **100** do not have any other embedded electrical components, such as within the frame, except those in one or both of the temple arrangements **112**. In another embodiment, the glasses **100** include one or more other electrical components embedded or attached to the frame of the glasses **100** and the components are electrically coupled to the one or more electrical components **112** in one or both of the temple arrangements **110**.

In different embodiments, the glasses **100** can be, for example, a pair of sunglasses, fit-over glasses, prescription glasses, reading glasses, or safety glasses.

FIG. **2** illustrates a diagram of a number of different embodiments of temple arrangements **200** according to the invention. A temple arrangement **200** can be a temple tip, a temple fit-over, or a temple cover. In one embodiment, a temple tip is a structure that attaches to a rearward portion of a temple. In one embodiment, a temple tip can pertain to an enclosure that grabs onto a rearward portion of a temple. A temple tip is particularly common for wire frame eyeglass where the temple tip attaches to the rearward end of the temple and provides a surface suitable for positioning proximate to the user's ear. For example, FIG. **1** illustrates the temple arrangement **112** implemented as a temple tip.

In one embodiment, a temple tip is removable from its corresponding temple so that it can be replaced. The temple tip can be originally provided with the purchase of a pair of eyeglasses. Alternatively, the temple tip can be a replacement part that can be purchased separately and subsequently mounted onto a rearward portion of a temple of a pair of eyeglasses after removing any original temple tip. In another embodiment, a temple tip is permanently held onto the corresponding temple, for example, by an adhesive (e.g., epoxy, glue, etc.).

In one embodiment, a temple fit-over fits over at least a portion of the rearward end of a temple. If the rearward end of the temple has a temple tip, at least a portion of the temple tip can be fitted over by the temple fit-over. In one embodiment, a temple cover slides over and at least partially covers a portion of the rearward end of a temple. If the rearward end of the temple has a temple tip, at least a portion of the temple tip can be covered by the temple cover.

A temple cover is typically made of a material that is more flexible than a temple fit-over. For example, a temple cover can be made of a fabric or other materials, such as a sock or sleeve; while a temple fit-over can be made of plastic.

A temple arrangement **200** can be made of the same or different materials than the temple or other parts of the frame of the pair of eyeglasses. To illustrate, a pair of glasses with a metal frame can have non-metallic temple tips. A temple arrangement **200** can be of a color that is the same as, or similar to, or different from, that of the temple.

A temple arrangement **200** can be held onto a temple by frictional force. For example, if the temple arrangement **200** is a temple fit-over, it can be held onto an existing temple or temple tip by frictional force. Here, the temple fit-over is often removable. In another embodiment, the temple arrangement **200** can be permanently held onto its corresponding temple or temple tip. For example, the temple arrangement can be permanently held onto the corresponding temple or temple tip, for example, by an adhesive (e.g., epoxy, glue, etc.).

Depending on applications, a temple arrangement can be of different shapes. The shape can depend on the type of glasses. For example, a temple arrangement for fit-over glasses can be bigger than a temple arrangement for prescription glasses. The shape of the temple arrangement can also depend on applications for the electronic component(s)

that are fully or partially embedded in the temple arrangement. Of course, aesthetic reasons can also influence shape (e.g., design, size, style) of a temple arrangement.

In one embodiment, the temple arrangement is a structure that has at least one electrical component attached thereto or at least partially embedded therein. In another embodiment, all of the electrical components to be provided with the temple arrangement are at least partially embedded in the temple arrangement.

FIG. **3A** is a diagram of a portion **300** of a pair of eyeglasses according to one embodiment of the invention. The portion **300** includes a temple **302** that is associated with a pair of eyeglasses. Over the end of the temple **302** that is opposite the associated lens holder, a temple tip **304** is provided. The temple tip **304** can, for example, be held to the temple **302** by frictional forces and/or adhesive. The temple tip **304** includes at least one electrical component **306** that is at least partially embedded therein. A wide range of functionalities can be provided by the at least one electrical component **306**. The temple tip **304** can be considered separate from or part of the temple **302**. For example, when the temple tip **304** is not attached to the temple **302**, the temple tip **304** is considered a separate part. As another example, when the temple tip **304** is attached to the temple **302**, the temple tip **304** can be considered separate from or part of the temple **302**.

The temple tip **304** can be manufactured and delivered to resellers or retailers and thereafter sold attached to eyeglasses. Alternatively, the temple tip **304** can be separately provided as an optional replacement temple tip for an original temple tip. Hence, after or during purchasing a pair of eyeglasses, upgrade of the eyeglasses can be had by replacing an existing temple tip with a replacement temple tip. The colors and shapes of the temple tip **304** can vary widely. In the after manufacturing environment, the reseller or retailer can be provided with a range of different colors and shapes so that a user can receive a replacement temple tip that reasonably matches the color and shape of the temple or that provides an altered appearance as desired by the user.

A number of embodiments have been described regarding one or more electrical components at least partially embedded in a pair of glasses. In one embodiment, one or more electrical components are at least partially embedded in a temple tip of a pair of glasses. Temple tips are relatively common for wire or metal frames which have wire or metal temples. The pair of glasses has a first and a second lens holders for receiving lenses. Each of the lens holders has a first side and a second side. The pair of glasses has a bridge element that couples the first side of the first lens holder to the second side of the second lens holder. The pair of glasses also includes a first temple and a second temple. The first temple is pivotally secured to the second side of the first lens holder through a joint, while the second temple is pivotally secured to the first side of the second lens holder through another joint. A temple typically has two ends, a first end and a second end. The first end can be the end that is pivotally secured to a lens holder through a joint, and the second end can be the other end of the temple. It is not uncommon that a temple includes a main body and an enclosure that grabs onto the main body of the temple. The second end is typically where the enclosure grabs onto the main body. The enclosure can be made of a different material than the main body of the temple. In one embodiment, such an enclosure is a temple tip, and there is an electrical component, partially or fully, embedded in the temple tip. There can also be a connector at the temple tip. In another embodiment, the temple tip can include a female connector. In still another

embodiment, as a temple tip grabs onto the main body of the temple, a connector at the temple tip (such as a female connector) can make electrical contact with another connector (such as a male connector) at the main body of the temple. Typically, particularly before a pair of glasses has been extensively worn, the temple tip can be removed and re-inserted back on to the main body of the temple without much difficulty. Such a temple tip can be an after-market component, with different temple tips having different electrical components to serve different functions.

Besides a temple tip such as illustrated in FIG. 3A, a temple tip can also be effectively modified by a fit-over temple or temple cover.

FIG. 3B is a diagram of a temple cover 320 that at least partially covers a temple (e.g., temple and/or temple tip) according to one embodiment of the invention. As an example, the temple cover 320 can be made of a fabric or other material, such as a sock or sleeve, that slides over and at least partially covers a temple or a temple tip. The temple cover 320 can include at least one electrical component 322 that is either attached thereto or at least partially embedded therein. The temple cover 320 can also include an opening 324 so as to receive a temple or a temple tip. In one embodiment, the temple cover 320 is placed over a substantial portion of a temple tip, and the opening 324 can extend to a far end 326 so as to receive all or a substantial part of the temple tip. The temple cover 320 can, for example, be held to a temple or a temple tip by frictional forces and/or adhesive.

FIG. 3C is a diagram of a fit-over temple 340 that at least partially fits over a temple (e.g., temple and/or temple tip) according to one embodiment of the invention. For example, the fit-over temple 340 can at least partially fit-over a temple tip. The fit-over temple 340 includes at least one electrical component 342 that is either attached thereto or at least partially embedded therein. The fit-over temple 340 can also include an opening 344 so as to receive a temple or a temple tip. The depth and/or width of the opening 344 within the fit-over temple 340 can vary depending on the extent to which it is being fit over a temple or a temple tip. The fit-over temple 340 can, for example, be held to a temple or temple tip by frictional forces and/or adhesive. As an example, the fit-over temple 340 can be plastic or other material. The colors and shapes of the fit-over temple 340 can have a lot of variations.

A wide range of functionalities can be provided by the at least one electrical component (e.g., electrical component 322 and 342). In the after manufacturing environment, the reseller or retailer can be provided with a range of different colors and shapes so that a user can receive a replacement temple cover or fit-over temple that reasonably matches the color and shape of the temple or that provides an altered appearance as desired by the user.

FIGS. 3D and 3E are diagrams of a temple arrangement 360 according to another embodiment of the invention. FIG. 3D is a side view of the temple arrangement 360, and FIG. 3E is a front view of the temple arrangement 360. In this embodiment, the temple arrangement 360 is a temple tip that can be attached to a temple (e.g., temple body) of a pair of eyeglasses. The temple arrangement 360 includes a speaker housing 362 allowing a speaker 364 to be at least partially embedded within the temple arrangement 360. An audio sound output by the speaker 364 is coupled to an ear plug 366 by way of the speaker housing 362 and a tube 368. Typically, the tube 368 is a flexible tube, such as a flexible plastic tube. A user of the eyeglasses having the temple arrangement 360 can place the ear plug 366 within her ear

to facilitate coupling of the audio sound from the speaker 364 to the ear. The tube 368 can have a disconnection region 370 whereby at least a section of the tube 368 and the attached ear plug 366 can be removed from the temple arrangement 360, such as when audio output is not being listened to. The tube 368 and/or the speaker housing 362 can also be capable of rotating with respect to the temple arrangement 360 to facilitate ease of use. Still further, the temple arrangement 360 can include a connector 372, such as a male audio connector (e.g., 2.5 mm, stereo mini-phone connector). The connector 372 provides a means to electrically connect an external audio source to the speaker 364 within the temple arrangement 360. For example, at least one wire (not shown) that is internal to the temple arrangement 360 can be used to electrically connect the speaker 364 to the connector 372.

In one embodiment, an electrical component is a component of an electrical circuit or system, and the electrical circuit or system is for performing at least a desired, intended or predetermined function.

In one embodiment, a temple tip, fit-over temple or temple cover according to the invention can further include a connector or cable to facilitate electrical connection with the at least one electrical component that is either attached to a temple or a temple tip or at least partially embedded therein.

Still another aspect of the invention relates to one or more swappable temple portions for a pair of glasses. According to this aspect, a temple has a forward portion and a rearward portion which can removably couple to one another. In one embodiment, different rearward portions can be used with the same forward portion. In other words, the different rearward portions can be swapped with one another. In one implementation, the different rearward portions can offer different electrical components/functionalities to the pair of glasses. For example, the different rearward portions can provide different electrical components/functionalities such as: battery/power, wireless communication, radio, headset, GPS, pedometer, sun sensor, hearing enhancement, image/video capturing, etc. In another embodiment, different forward portions can be used with the same rearward portion.

In one embodiment, only one of the temples of an eyeglass frame has swappable part(s). In another embodiment, both of the temples of an eyeglass frame have swappable part(s). Regardless, viewed in one way, each of the swappable parts at a temple can be viewed as a removable peripheral device to the eyeglass frame.

In one embodiment, a temple is a multi-part temple. The multi-part temple includes at least a forward (or first) part and a rearward (or second) part. The forward part is typically integral with or coupled to an eyeglass frame (such as at the lens holder or hinge region of an eyeglass frame). The rearward part removably connects with the forward part. The removable connection allows the rearward part to be removed for any of a variety of reasons. For example, the rearward part can be removed to: (1) connect a different rearward part; (2) connect to a peripheral bus (e.g., for data download); or (3) charge a battery (e.g., located in forward or rearward part).

The removable connection between the forward and rearward parts of the multi-part temple physically attaches and secures the rearward part to the forward part by way of at least a mechanical connection. The mechanical connection can be provided in a variety of ways, such as through use of one or more connectors, snaps, detents, bayonets, etc.

In addition, the removable connection between the forward and the rearward parts of the multi-part temple can

provide (or facilitate) an electrical connection between the forward and rearward parts. In one embodiment, the forward part of the temple (or some other part of the eyeglass frame) includes one or more electrical components, and the rearward part includes one or more electrical components. In such case, the electrical connection serves to electrically connect one or more of the electrical components of the forward part (or other part of the eyeglass frame) with one or more of the electrical components of the rearward part. For example, the forward part of the temple can include one or more electronic components (e.g., integrated circuit) that are electrically connected to one or more electronic components in the rearward part.

However, in the event that all needed electrical components are within the rearward part of the multi-part temple, electrical connection between the forward part and the rearward part may not be needed. Accordingly, in some embodiments, no electrical components will be needed in the forward part; instead, all the needed electrical components will be provided in the rearward part.

Various embodiments of eyewear can utilize the multi-part temples to provided electrical components to eyeglass frames in a convenient and user friendly manner. As one example, consider an eyeglass frame that supports a camera. The electrical components can include an image sensor, a memory, a microcontroller, and a battery. One or more of these electrical components can be in the forward part (or other part of the eyeglass frame) and the remaining one or more electrical components can be in the rearward part. For example, the image sensor and the microcontroller can be in the forward part and the battery and the memory can be in the rearward part. Additionally, if the camera makes use of a display (e.g., LCD), the display could be in either the forward part or the rearward part. The eyeglass frame might also include other electrical components for additional functionality. Examples of additional functionality include: global positioning system, antenna, user interface (e.g., buttons, switches, etc), display, microphone, earphone, etc. In another example, all of the electrical components supporting the camera functionality can be provided in the rearward part of the multi-part temple.

In one embodiment, the electrical components provided in the forward part are able to be shared with different rearward parts. In other words, different rearward parts can be swapped. For example, a different rearward part can be connected to the forward part to provide the eyeglass frame with different functionality. Examples of some of the different functionality that can be provided in this matter include: radio receiver (e.g., satellite radio), media player, pedometer, wireless communication, sun monitor, hearing enhancement, global positioning, etc. In a first example, in the case of a radio receiver, the forward part can include a display, while the rearward part can include a tuner, a rechargeable battery, an amplifier, and earphones or earphone connectors. In a second example, in the case of a media player, the forward part can include a display, while the rearward part can include a media player module, a memory, a rechargeable battery, a switch and earphones or earphone connectors. In a third example, in the case of a pedometer, the forward part can include a display, while the rearward part can include an accelerometer, a rechargeable battery, a memory and a microcontroller. In a fourth example, in the case of a wireless communication device, the forward part can include a display, while the rearward part can include a battery, an antenna, a wireless module, earphones or earphone connectors, and a user interface. The user interface, for example, can include buttons, which, for

example, can facilitate user input with respect to on/off, volume, and accept or decline call. In this case, information displayed can include battery status, device status, caller ID, etc. In these four examples, the forward part includes a display and thus the forward part can be used (i.e., shared) with any of the different rearward parts to thereby provide different functionality to the eyeglass frames. Hence, by swapping one of these different rearward parts, the same pair of eyeglasses can provide different functionality.

A multi-part temple can be manufactured and delivered to resellers or retailers and thereafter sold attached to eyeglasses. Alternatively, a rearward part can be separately provided as a separate part or as an optional rearward part that can be swapped with an original rearward part. Hence, after or during purchasing a pair of eyeglasses, alteration, upgrade or conversion of the eyeglasses can be had by swapping in another rearward part. The electrical components or functions supported by the rearward part can vary widely. The colors and shapes of the rearward parts also can vary widely. For example, in the retailing or after manufacturing environment, the reseller or retailer can be provided with a range of different colors and shapes so that a user can receive a rearward part that reasonably matches the color and shape of the multi-part temple or that provides an altered appearance as desired by the user.

FIG. 3F is a diagram of a multi-part temple **1300** according to one embodiment of the invention. The multi-part temple **1300** has a forward part **1302** and a rearward part **1304**. The rearward part **1304** is removably connected to the forward part **1302** such that the rearward part **1304** is removable. Once removed, the same rearward part or a different rearward part can be later connected to the forward part **1302**. Alternatively, a cable can be connected to the forward part **1302** when the rearward part **1304** is removed. The cable can facilitate data transfer, battery charging, etc, depending on the electrical components in the forward part **1302**.

FIG. 3G is a diagram of a multi-part temple **1310** according to one embodiment of the invention. The multi-part temple **1310** can represent the multi-part temple **1300** shown in FIG. 1 in one embodiment. In FIG. 3G, a forward part **1312** and a rearward part **1314** are shown disconnected. The forward part **1312** has a mechanical element **1316** and the rearward part **1314** has a corresponding opening **1318**. Once connected together, the mechanical element **1316** of the forward part **1312** is inserted into the opening **1318**, thereby mechanically coupling the rearward part **1314** to the forward part **1312**. Once mechanically coupled the rearward part **1314** is secured to the forward part **1312**, but remains removable.

FIG. 3H is a diagram of a multi-part temple **1320** according to one embodiment of the invention. The multi-part temple **1320** can represent the multi-part temple **1300** shown in FIG. 1 in one embodiment. In FIG. 3H, a forward part **1322** and a rearward part **1324** are shown disconnected. The forward part **1322** has a connector **1326** and the rearward part **1324** has a corresponding connector **1328** embedded therein. Once connected together, the connector **1326** of the forward part **1322** is inserted into the corresponding connector **1328**, thereby mechanically coupling the rearward part **1324** to the forward part **1322**. Once mechanically coupled the rearward part **1324** is secured to the forward part **1322**, but remains removable. Additionally, the connection of the connector **1326** and the corresponding connector **1328** can also provide an electrical connection. An electrical connection would serve to enable electrical components in the forward part **1322** (or other parts of an eyeglass frame)

13

to electrically connect to electrical components in the rearward part **1324**. For example, the electrical connection can provide electrical connections for one or more electrical wires. An example of one suitable type of connector is a USB connector which can provide mechanical and electrical connection.

As noted above, a rearward part of a multi-part temple can include one or more electrical components. FIG. 3I is a diagram of a rearward part **1330** of a multi-part temple according to one embodiment of the invention. The rearward part **1330** has a body **1332** with electrical circuitry **1334** internal to the body **1332**. As one example, the electrical circuitry **1334** can pertain to data storage (e.g., memory). In such an example, the rearward part **1330** can be considered a memory stick or a memory card. As other examples, the electrical circuitry **1334** can pertain to a battery/power source, a sun sensor, a pedometer, a media player, a wireless module, etc.

FIG. 3J is a diagram of a rearward part **1340** of a multi-part temple according to another embodiment of the invention. The rearward part **1340** has a body **1342** with an ear bud **1344** and an ear bud arm **1346** extending therefrom. In addition, the body **1342** includes at least one conductor **1347** and electrical circuitry **1348** internal to the body **1342**. The at least one conductor **1347** can electrically connect the electrical circuitry **1348** with the ear bud **1344**, where the at least one conductor **1347** extends through the ear bud arm **1346** to the ear bud **1344**. Optionally, the body **1342** can further include an antenna **1349** internal to the body **1342**. In the case where the electrical circuitry **1348** includes a wireless receiver (e.g., Bluetooth, XM, FM), the antenna **1349** can enhance reception. As an example, the electrical circuitry **1348**, can be a wireless module for wireless communications or a receiver for XM or FM signals. Additionally or alternatively, the electrical circuitry **1348** can, for example, pertain to one or more of a data storage device, battery/power source, a sun sensor, a pedometer, a media player, etc.

FIG. 3K is a diagram of a rearward part **1350** of a multi-part temple according to another embodiment of the invention. The rearward part **1350** has a body **1352** with a printed circuit board **1354** internal to the body **1352**. A display device **1356** (e.g., LCD) can be provided on the body **1352**. In one example, the display device **1356** can be mounted to the circuit board **1354** and exposed through an opening in the body **1352** so as to be visible by a user of the eyeglasses using the multi-part temple. Optionally, at least a portion of the printed circuit board **1354** can conform to the shape of the body **1352**. The ability to conform, even partially, allows the printed circuit board **1354** to yield greater surface area within a temple, which tends to be small and stylized. The integrated circuit board **1354** can have one or more electronic components (e.g., integrated circuits) mounted thereon.

FIGS. 3L-3O are diagrams of representative forward parts for multi-part temples according to different embodiments of the invention. FIG. 3L is a diagram of an exemplary forward part **1360** having a mechanical element **1362** that includes one or more detents **1364**. When a rearward part is connected to the forward part **1360**, the mechanical element **1362** is inserted into an opening (e.g., opening **1318**) and held securely in place by mechanical forces facilitated by the mechanical element **1362** and the detents **1364**. This can be accomplished through different methods, such as with corresponding protruding portions in the opening that can, for

14

example, be aligned with the detents **1364**. For example, the protruding portions can snap into place or biased by springs (e.g., spring-loaded).

FIG. 3M is a diagram of an exemplary forward part **1370** having a mechanical element **1372** that includes one or more protrusions **1374**. When a rearward part is connected to the forward part **1370**, the mechanical element **1372** is inserted into an opening (e.g., opening **1318**) and held securely in place by mechanical forces facilitated by the mechanical element **1372** and the protrusions **1374**. In one embodiment, the protrusions **1374** are spring-loaded to facilitate connection with the opening.

FIG. 3N is a diagram of an exemplary forward part **1380** having a mechanical element **1382** that includes one or more bayonet structures **1384**. To connect a rearward part to the forward part **1380**, the mechanical element **1382** is inserted into an opening (e.g., opening **1318**) that has grooves (in the direction substantially parallel to the axis of the mechanical element **1382**) for receiving the bayonet structures **1384**. The rearward part can be connected with the forward part **1380** when the grooves within the opening of the rearward part are aligned with the bayonet structures **1384**. Once the mechanical element **1382** is so inserted, the rearward part can be rotated with respect to the forward part **1380**. The rotation causes the bayonet structures **1384** to no longer be aligned with the grooves. As a result, the rearward part is mechanically secured to the forward part **1380** (and thus the eyeglass frame) in a bayonet like manner.

In one embodiment, a connector is used to removably couple the rearward portion to the forward portion of a multi-part temple. For example, the connector can be standard connector. One example of a suitable connector is a Universal Serial Bus (USB) connector.

FIG. 3O is a diagram of an exemplary forward part **1390** having an electrical connector **1392**. The connector **1392** facilitates mechanical and/or electrical connections between the forward part **1390** and a rearward part. When a rearward part is connected to the forward part **1390**, the connector **1392** is inserted into an opening (e.g., opening **1328**) and held securely in place by mechanical forces. There can be additional mechanical connecting mechanisms to further secure the connection.

In one embodiment, the opening receiving the connector **1392** can include a corresponding (i.e., counterpart) connector. When the connector **1392** is connected with the corresponding connector within the opening, the rearward part is physically secured to the forward part **1390**. For example, mechanical forces can hold the connector **1392** and the corresponding connector in a connected position. In addition, when the connector **1392** and the corresponding counterpart connector are coupled together, one or more electrical connections are facilitated. For example, each connector can be coupled to one or more electrical wires at the other connector so that wires from one part are able to be connected to corresponding wires on the other part. As a result, electrical component(s) in the rearward part are able to be electrically connected with electrical component(s) in the forward part **1390** (or elsewhere in the eyeglass frame). In one implementation, the connectors pertain to or resemble a Universal Serial Bus (USB) type connector.

In another embodiment, the opening receiving the connector **1392** does include a corresponding counterpart connector. In this embodiment, mechanical forces can hold the connector **1392** within the opening. Also, in this embodiment, electrical connections are not facilitated.

Although FIGS. 3G-3N pertain to connections having a male connector at the forward part and a female connector

at the rearward part, it should be understood that alternatively the male connector can be at the rearward part and the female connector can be at the forward part.

Also, although FIGS. 3G-3N pertain to connections showing only one elongated portion (like a male connector) to be received by an opening (like a female connector), in other embodiments, there can be more than one elongated portion to be received by more than one opening. Also, the connections can be formed on the sides (i.e., outer surface), instead of by having elongated portions and openings positioned in the middle of (i.e., internal to) the forward and rearward parts. For example, there can be two prongs, one on the top surface and one on the bottom surface of a forward part. Each prong can be received by a counterpart detent in a rearward part, such as the prong on the top surface of the forward part to be received by a detent on the top surface of the rearward part.

In a number of embodiments, the forward part of the multi-part temple is substantially smaller than the rearward part. For example, in FIG. 3F, the forward part 1302 is substantially smaller than the rearward part 1304. In one embodiment, a forward part is large enough to house a connection mechanism used to couple with a rearward part and not too much larger. In another embodiment, a forward part and a rearward part are about the same size. In still another embodiment, a forward part is larger than a rearward part.

In one embodiment, neither the forward part nor the rearward part of a multi-part temple contains any electrical components. In such case, the rearward part can still be removable from the forward part. Such an embodiment enables a user to swap one (which can be substantially all of the temple) or both the rearward portions of both temples, with another rearward portion(s), such as for aesthetic, configuration or design reasons.

In one implementation, a connector is used to removably couple the rearward portion to the forward portion of the multi-part temple. For example, the connector can be a Universal Serial Bus (USB) connector.

In one embodiment, a forward part can be part of or integral with a corresponding region of a lens holder. In such case, there need not be any hinges for coupling the temples to the lens holders.

As noted above, connectors can be used to removably attach a temple to an eyeglass frame (e.g., lens holder) or to removably attach different portion(s) of a temple. These connectors can be provided for one or both temples of the eyeglass frames. With such temples being easily removable by users without the need for any special skill or tools, the temple parts can be interchangeable and can be separately sold or leased.

Further, to display various eyewear products, such as in a retail environment, an eyewear products display apparatus (e.g., stand) can include corresponding connectors or connector structures so that (i) separate temples (ii) separate parts of temples and/or (iii) eyeglass frames without temples can be connected to the eyewear products display apparatus for display. For example, if the eyewear products (e.g., frames, temples, etc.) use connectors, then the eyewear products display apparatus can support those same connectors (e.g., USB connectors) or compatible structures. This eyewear products display apparatus opens up new ways to organize and present eyewear products at retail stores. It also allows users to separately select a base eyewear frame and temples to be used therewith. The temples and the frames can be displayed detached from one another, such that a user can separately select and try different temples with frames.

FIG. 3P is a diagram of an eyewear products display apparatus 1400 according to one embodiment of the invention. The apparatus 1400 has a first region 1404 of first type connectors (or compatible protrusions) integral with the apparatus 1400. A plurality of eyeglass frames having second type connectors can be attached and displayed on the apparatus 1400 by connecting one or two of the second type connector of the eyeglass frames to those of the first type connectors of the first region of the apparatus 1400.

The apparatus 1400 also can include a second region 1402 of second type connectors (or compatible openings) integral with the apparatus 1400. A plurality of removable temples (and/or removable temple parts) having first type connectors can be attached and displayed on the apparatus 1400 by connecting the first type connectors of the removable temples (and/or removable temple parts) to those of the second type connectors (or compatible openings) in the second region 1402 of the apparatus 1400.

In one embodiment, the first type connectors are male connectors and the second type connectors are corresponding female connectors which provide a secure mechanical connection. In one embodiment, the first type connectors and/or the second type connectors provided integral with the apparatus 1400 are not electrical connectors but compatible structures (e.g., protrusions and openings) such that a secure mechanical connect can be had.

In one embodiment, the orientation of at least some of the connectors in the apparatus 1400 is substantially horizontal. In other words, for example, when a rearward part of a temple is inserted into such a connector in the apparatus 1400, the rearward part is substantially perpendicular to the surface of the apparatus 1400 as shown. In another embodiment, the orientation of at least some of the connectors in the apparatus 1400 is substantially facing upward or downward in a vertical manner. In other words, for example, when a rearward part of a temple is inserted into such a connector in the apparatus 1400, the rearward part is substantially parallel to the surface of the apparatus 1400 as shown. In yet another embodiment, the orientation is at an acute angle relative to the surface of the apparatus 1400 as shown. In other words, for example, when a rearward part of a temple is inserted into a connector in the apparatus 1400, the rearward part is at an acute angle relative to the surface of the apparatus 1400 as shown. The connectors in the apparatus 1400 can also be rotatable or movable, such as between different positions and/or angles.

Although FIG. 3P only depicts one side of the eyewear products display apparatus 1400, the apparatus can have other like sides. For example, the apparatus 1400 can be a one, two, three or four sided apparatus.

In still another embodiment, at least one connector of the apparatus 1400 is connected to at least one electrical component in the apparatus 1400. For example, when a selected temple part is connected to the connector, the at least one electrical component in the apparatus 1400 is electrically connected to an electrical component in the temple part, and together can perform an electrical operation.

In yet another embodiment, at least one connector of the apparatus 1400 is connected to another connector of the apparatus 1400. This allows electrical connection between the different eyewear parts connected to the apparatus 1400. For example, when a selected temple part is connected to the connector and an eyeglass frame is connected to the other connector, an electrical component within the eyeglass frame is electrically connected to an electrical component in the temple part, and together can perform an electrical operation.

FIG. 4 shows examples of different electrical components according to the present invention. Different embodiments of temple arrangements, temple adapters or temple parts according to the invention can use one or more of these different electrical components.

In one embodiment, the electrical component is an electrical connector. The connector can be a male connector or a female connector. Examples of different types of connectors have previously been described in the related patent applications, which have been incorporated by reference.

In one embodiment, the embedded electrical component is an electrical switch, such as one or more of those previously described in the related patent applications, which have been incorporated by reference.

In one embodiment, one electrical component can be a power source. The power source can be a battery, a solar cell or other type of power source.

In one embodiment, one electrical component can include a circuit board. The circuit board can be a rigid or a flexible circuit board.

In one embodiment, one electrical component can be an indicator. The indicator can be audio, visual, or physical (e.g., vibration). For example, the indicator can signal an event or condition to a user of the glasses.

In one embodiment, one electrical component can be a display, such as a LCD display.

In one embodiment, one electrical component can be a speaker. The speaker can provide an audio output for the benefit of the wearer of the glasses. The speaker can directly transmit sound to a user, such as a speaker mounted on an exterior surface of an eyeglass frame, or partially or fully embedded in an eyeglass frame, or a bone conducting type of speaker. Alternatively, the speaker can indirectly transmit sound to a user, such as through the use of a tube to deliver audio output proximate to a user's ear.

The eyewear can contain lenses, either vision corrective lenses or non-corrective lenses. Examples of eyewear using corrective lenses include, for example, prescription glasses, bi-focal glasses, reading glasses, driving glasses, and progressive glasses. Examples of eyewear, using corrective or non-corrective lenses, are sunglasses, fit-over glasses, safety glasses, sports glasses, swim masks or goggles and ski goggles. The eyewear can also include wrap-around glasses (with wrap-around lenses), fit-over glasses, or auxiliary frames (which attach to existing frames). Still further, the eyewear can include a strap for glasses, such as a strap to hold glasses on one's head. The strap can include some or all of the components for monitoring radiation, such components can be attached or at least partially embedded in the strap.

In one embodiment, one electrical component can be a controller. The controller can, for example, be a microprocessor.

In one embodiment, one electrical component can be a memory device. The memory device can be non-volatile memory, such as FLASH memory. The data stored in the memory device can be user data or data provided by other electrical components.

In one embodiment, one electrical component is a frequency receiver or a frequency transmitter. They can be in the radio frequency range.

In one embodiment, one electrical component can be a sensor. The sensor can be a temperature sensor. The temperature sensor can be used to sense the temperature of the wearer. In one embodiment, such a temperature sensor is in a temple tip. In measuring the temperature, the user can further press the temple tip towards his head to ensure better

connection. One can also put the temple under one's tongue to measure body temperature.

In other different embodiments, one electrical component can be a motion detector, a speed sensor, a rate of ascent (or descent) detector, a pressure detector, or a detector for radiation, such as an ultraviolet (UV) detector.

In one embodiment, one electrical component is a radio frequency identification (RFID) tag. A RFID tag typically includes a memory chip and a radio antenna. The memory chip usually has a small storage capacity and thus does not include a large amount of information. A portion of such information can provide identifying information for the glasses. The memory chip may only have a few kilobytes, sufficient to encode information, such as a serial number, where and when the product (such as eyeglasses) was manufactured, and other relevant information.

The RFID tags can come in a number of configurations. For example, an active tag uses a battery-powered transponder to constantly emit signals which can carry information programmed into the memory chip. Active tags are more applicable to situations where readers are not close to the tags. A semi-passive tag likewise has a battery, but may not be activated until it receives a signal from a reader. They are more applicable to situations that do not need continuous connection and accessing. A passive tag has no battery; its antenna extracts power from a reader's radio wave signal to transmit the identifying information. Passive tags are typically relatively inexpensive, but may have to be within a few feet of a reader to extract power. The electrical component can be a passive RFID tag, or some other type of tag.

In one embodiment, one electrical component can be for locating the corresponding glasses. For example, the electrical component can produce a beeping tone when it receives a specific radio signal. A handheld device (such as a key chain accessory, can generate the specific radio signal (e.g., when a button is pushed). Through the beeping tone, one can locate the glasses.

As noted above, in one embodiment, the electrical component can be a sensor. More generally, a pair of glasses can include one or more sensors that can be used individually or in combination. FIG. 5 is a chart 500 that depicts examples of sensors suitable for use in or attached to the glasses.

In one embodiment, the sensor is a "being worn" sensor. The "being worn" sensor indicates whether the glasses are being worn by its user. The "being worn" operation can be performed using, for example, a thermal sensor, a motion detector, a stress sensor or a switch.

In one embodiment, a motion detector is used as a "being worn" sensor. A threshold can be set, such that if the amount of motion exceeds the threshold, the glasses are assumed to be worn. The motion detector can, for example, be achieved by a mechanical mechanism or an accelerometer.

In another embodiment, the "being worn" sensor includes two thermal sensors. One sensor can be at approximately the middle of a temple, such as in a region that touches the head of the user wearing the glasses. The other sensor can be at one end of the temple, the end that is close to its hinge. If the temperature differential between the two sensors is beyond a certain preset value, the glasses would be assumed to be worn. The differential is presumed to be caused by a person wearing the pair of glasses.

In yet another embodiment, the "being worn" sensor includes a stress sensor at the hinge of the temple. The assumption is that when the eyewear is worn, the hinge is typically slightly stretched because typically, the width of the head of the user is slightly wider than the width between the temples when the two temples are in the extended

positions. If the value of the stress sensor is beyond a certain preset value, the glasses would be assumed to be worn.

In a further embodiment, the “being worn” sensor can be a switch. For example, at the hinge between a temple and its corresponding lens holder, there is a switch. When that temple is in its extended position, i.e., fully extended outwards, the switch is turned on. The switch can be a pin-type switch. When the temple is fully extended outwards, the pin is pressed. When both temples are fully extended outwards, in one embodiment, the glasses would be assumed to be worn by the user.

In one embodiment, another type of sensor is an environmental sensor. The environmental sensor can sense environmental conditions, such as one or more of radiation (e.g., ultraviolet radiation or light), temperature (e.g., ambient temperature), pressure, humidity and toxins (e.g., chemicals, etc.).

In another embodiment, another type of sensor is a condition sensor. The condition sensor can sense the conditions of the user of the glasses. Examples of condition sensors include sensing one or more of distance traveled, location, speed, calories consumed, temperature and vital signs associated with the user of the glasses. The distance traveled could represent the horizontal distance traveled or the vertical distance (i.e., elevation) traveled. The speed can be the rate of movement along the horizontal distance traveled and/or the vertical distance. In yet another embodiment, the condition sensor can indirectly sense emotional conditions of the user of the glasses.

The sensors can be provided in a redundant or fault-tolerant manner. For example, sensors can come in pairs in the glasses. When one malfunctions, the other one will take over its operation. In another embodiment, the sensor information can be processed in a differential manner to examine changes to the sensor information. The differential can be based on time. The sensors can be powered by a battery, solar energy, or kinetic energy. For reduced power consumption, the sensors can remain in a low-power state unless data is being acquired by the sensors. In yet another embodiment, two or more of the sensors can communicate with one another (wired or wirelessly) to exchange data or control information.

FIG. 6 illustrates a diagram of a number of different embodiments of temple adapters 600 according to the invention. The temple adapters 600 serve to adapt a temple (i.e., a temple body or temple tip) of a pair of eyeglasses to provide for at least one electrical component. In one embodiment, a temple adapter can clip onto a temple body or a temple tip. In another embodiment, a temple adapter can mount to a post provided on a temple body or a temple tip. In still another embodiment, a temple adapter can mount to a hole provided in a temple body or a temple tip. In yet another embodiment, a temple adapter can be bonded (or adhered) to a temple body or a temple tip.

The temple adapter is particularly well suited to adapt a pair of eyeglasses with communication components, such as a speaker and/or a microphone. As an example, a standard pair of eyeglasses can be transformed into an operational headset by attaching a temple adapter to a temple body or temple tip of the pair of eyeglasses, wherein the temple adapter includes at least one speaker and at least one microphone.

The temple adapter can be rigid or malleable. The benefit of being malleable is that the particular geometric arrangement/assembly of the temple adapter can be altered by its user for better user comfort or operation.

In one embodiment, the temple adapter is a structure that has at least one electrical component attached thereto or at least partially embedded therein. In another embodiment, all of the electrical components to be provided with the temple adapter are at least partially embedded in the temple adapter.

FIG. 7A is a diagram of a temple adapter 700 according to one embodiment of the invention. The temple adapter 700 attaches to a temple 702 (including any temple tip using a clip 704. The clip 704 can use force, such as an interference fit force or spring-induced force, to attach the temple adapter 700 to the temple 702. Besides the clip 704, the temple adapter 700 includes an angled arm 706 and an ear bud 708. The angled arm 706 can be malleable. When a pair of eyeglasses associated with the temple 702 is being worn by a user, the ear bud 708 can be placed in or near the user’s ear canal. The ear bud 708 contains a speaker and receives electrical signals via a wire, such wire can be provided internal or external to the temple adapter 700 and can originate at the temple 702 or external to the temple 702.

FIG. 7B is a diagram of a temple adapter 720 according to another embodiment of the invention. The temple adapter 720 attaches to a temple 722 (including any temple tip) using a clip 724. The clip 724 can use force, such as an interference fit force or spring-induced force, to hold the temple adapter 720 to the temple 722. Besides the clip 724, the temple adapter 720 includes an angled arm 726, an ear bud 728, a microphone 730, an extension arm 732 and a cord 734. In this embodiment, the cord 734 includes a wire that connects to the speaker within the ear bud 728 and another wire that connects to the microphone 730. There can be one or more conductors inside a given wire. For example, a wire might have one conductor serving as a signal line and another conductor serving as ground. Such wires can be provided internal to the extension arm 732 and the angled arm 726. The arm 732 can serve to guide the cord 734 away from the user’s ear or rearward. The angled arm 726 can be malleable. The placement or position of the microphone 730 can vary with implementation. As shown in FIG. 7B, the microphone 730 is directed forward to a user’s front when a pair of eyeglasses associated with the temple 722 are being worn. Alternatively, the microphone 730 could be directed outward away from the user’s head when the pair of eyeglasses are being worn. When a pair of eyeglasses associated with the temple 722 is being worn by a user, the ear bud 728 can be placed in or near the user’s ear canal. The ear bud 728 contains a speaker and receives electrical signals via a wire of the cord 734. The cord 734 can have another end (not shown) with a connector for coupling with an audio output device (e.g., radio, MP3 player) or a communication device (e.g., mobile phone).

FIGS. 8A and 8B are diagrams of a temple adapter 800 according to another embodiment of the invention. FIG. 8A is a side view of the temple adapter 800, and FIG. 8B is a front view of the temple adapter 800. The temple adapter 800 has a support body 802 which has a support arm 803. An ear bud 804 is attached to an end of the support arm 803. A connector 806, such as a male audio connector, is attached to one end of the support body 802. A microphone 808 can be optionally provided and attached to the support body 802 or the support arm 803. Additionally, an elastic member 810 can be provided to facilitate attachment of the support body 802 to a temple 812 of a pair of eyeglasses. The temple 812 can have a tip region 814, which can be referred to as a temple tip. When the temple adapter 800 is attached to the tip region 814 of the temple 812, the tip region 814 is placed in or through an opening 816 in the elastic member 810, as shown, for example, in FIG. 8B. The temple adapter 800 is

thereby held in place relative to the tip region 814. Additionally, although not shown, the support body 802 would carry a first internal wire from the connector 806 to the microphone 808, and the support body 802 and the support arm 803 would carry a second internal wire from the connector 806 to the ear bud 804.

FIG. 9A is a diagram of a temple adapter 900 according to another embodiment of the invention. In FIG. 9A, a side-view of the temple adapter 900 is depicted. The temple adapter 900 attaches to a temple 902 of a pair of eyeglasses. The temple 902 can have a tip region 904, which can be referred to as a temple tip. The temple adapter 900 has a support member 906. A first end 908 of the support member 906 couples to the temple 902 of a pair of eyeglasses. In one embodiment, the first end 908 serves to attach the temple adapter 900 to the temple 902. For example, the first end 908 can provide a clip, clamp, post, or hole to provide or assist with the attachment. As another example, the first end 908 can alternatively or additionally use an adhesive, bonding or fastener (e.g., hook and loop system, such as Velcro) to provide or assist with the attachment. A second end 910 of the support member 906 provides an opening through which an arm 912 extends. One end of the arm 912 has an ear bud 914 attached thereto. The arm 912 can be angled and/or malleable. When a pair of eyeglasses associated with the temple 902 is being worn by a user, the ear bud 914 can be placed in or near the user's ear canal. The ear bud 914 contains a speaker and receives electrical signals via a wire, such wire can be provided internal or external to the temple adapter 900 and can originate at the temple 902 or external to the temple 902.

FIGS. 9B and 9C are diagrams of a temple adapter 920 according to still another embodiment of the invention. FIG. 9B is a side view of the temple adapter 920, and FIG. 9C is a front view of the temple adapter 920. The temple adapter 920 attaches to a temple 922 of a pair of eyeglasses. The temple 922 can have a tip region 924, which can be referred to as a temple tip. The temple adapter 920 has a support member 926. A first end 928 of the support member 926 couples to the temple 922 of a pair of eyeglasses. In one embodiment, the first end 928 serves to attach the temple adapter 920 to the temple 922. For example, the first end 928 can provide a clip, clamp, post, or hole to provide or assist with the attachment. As another example, the first end 928 can alternatively or additionally use an adhesive, bonding or fastener (e.g., hook and loop system, e.g., Velcro) to provide or assist with the attachment. The first end 928 also has a bracket 930 having a connector 932 at one end, and an elastic member 934 for coupling about the tip region 924. The connector 932, such as a male audio connector, is attached to one end of the bracket 930. A microphone 936 can be optionally provided and, for example, attached to the support body 926.

A second end 938 of the support member 926 provides an opening through which an arm 940 extends. One end of the arm 940 has an ear bud 942 attached thereto. The arm 940 can be angled and/or malleable. The arm 940 is also repositionable within the opening at the second end 938 so as to permit user adjustment. When a pair of eyeglasses associated with the temple 922 is being worn by a user, the ear bud 942 can be placed in or near the user's ear canal. The ear bud 942 contains a speaker and receives electrical signals via a wire, such wire can be provided internal or external to the temple adapter 920 and can originate at the temple 902 or external to the temple 902. In this embodiment, a wire 944 is shown as passing through the arm 940 to provide signals to the speaker within the ear bud 942. More particularly, in

one embodiment, although not shown in FIGS. 9B and 9C, a first wire would connect the speaker within the ear bud 942 to the connector 932 (e.g., wire 944), and a second wire would connect the microphone 936 to the connector 932. Such wires can be internal or external, or partially internal and partially external, to the temple adapter 920.

FIG. 9D is a diagram of a temple adapter 960 according to still another embodiment of the invention. In FIG. 9D, a side-view of the temple adapter 960 is depicted. The temple adapter 960 attaches to a temple 962 of a pair of eyeglasses. The temple 962 can have a tip region 964, which can be referred to as a temple tip. The temple adapter 960 has a support member 966. A first end 968 of the support member 966 couples to the temple 962 of a pair of eyeglasses. In one embodiment, the first end 968 serves to attach the temple adapter 960 to the temple 962. For example, the first end 968 can provide a clip, clamp, post, or hole to provide or assist with the attachment. As another example, the first end 968 can alternatively or additionally use an adhesive, bonding or fastener (e.g., hook and loop system, e.g., Velcro) to provide or assist with the attachment. A second end 970 of the support member 966 provides an opening through which an arm 972 extends. One end of the arm 972 has an ear bud 974 attached thereto. The arm 972 can be angled and/or malleable. When a pair of eyeglasses associated with the temple 962 is being worn by a user, the ear bud 974 can be placed in or near the user's ear canal. The ear bud 974 contains a speaker and receives electrical signals via a wire, such wire can be provided internal or external to the temple adapter 960 and can originate at the temple 962 or external to the temple 962. Further, the temple adapter 960 can include a microphone 976. In this embodiment, the microphone 976 is attached to the support member 966. In addition, an arm 978 is used to support an end of a cable 980 that is coupled to the arm 978. The cable 980 can include at least one wire for the microphone 976 and one wire for the speaker within the ear bud 974.

To the extent that any of the embodiments of the temple adapters discussed above use a microphone, a tube can be optionally attached to the microphone to facilitate voice pick-up of the user. One end of the tube can be placed over the microphone, and the other end of the tube is then positioned closer to the user's mouth than is the microphone. With a temple adapter on both temples, each providing a microphone and speaker to a pair of eyeglasses, only one temple adapter would typically make use of such a tube. Alternatively, the tube and the microphone could be replaced by a boom microphone.

FIG. 10A-10C are diagrams of a temple having a bone conducting element according to still other embodiments of the invention. The bone conducting elements can replace a traditional speaker to provide audio output to a user. Although not shown, electrical signals would be internally or externally supplied to the bone conducting element.

FIG. 10A illustrates a temple 1000 for a pair of eyeglasses. The temple 1000 includes a bone conducting element 1002 that can provide audio sound to a user by coupling vibrations to at least one bone of the user's face. The bone conducting element 1002 is held relative to the temple 1000 by an arm 1004. Hence, in this embodiment, the temple 1000, the arm 1004 and the bone conducting element 1002 can all be integrally formed.

FIG. 10B illustrates a temple 1020 for a pair of eyeglasses. The temple 1020 includes a bone conducting element 1022 that can provide audio sound to a user by coupling vibrations to at least one bone of the user's face.

The bone conducting element **1022** is held relative to the temple **1020** by a support **1024** that removably attaches to the temple **1020**.

FIG. **10C** illustrates a temple **1040** for a pair of eyeglasses. The temple **1040** includes a bone conducting element **1042** that can provide audio sound to a user by coupling vibrations to at least one bone of the user's head. In this embodiment, the bone conducting element **1042** is positioned in the vicinity of the user's ear, such as behind the user's ear. The placement of the bone conducting element **1042** in this embodiment can reduce impact to the design of the eyeglasses.

In one embodiment, the electrical components associated with a temple arrangement, a temple adapter or a removable temple part is for enhancing the hearing of the person wearing the corresponding pair of glasses. There can be at least a microphone and a speaker in a temple arrangement, a temple adapter or removable temple part. The microphone can be close to an ear of the user when the glasses are worn by the user, and can be a directional microphone. The microphones can be a microphone in a temple adapter, such as the microphone **730** in FIG. **7B**, **808** in FIG. **8A**, **936** in FIG. **9B**, or **976** in FIG. **9D**. The microphones can be in a temple arrangement. The microphone in a temple arrangement can be attached to a temple tip, a temple fit-over or a temple cover. The microphones can be positioned to be in front of the user's ears so that the microphones will not be affected by the shadowing effect of the ears. The speaker can be inserted into the ear, as in some of the speakers previously described.

In another embodiment, there are two sets of microphones and speakers, such as in two temple arrangements, temple adapters or removable temple part. In the vicinity of each ear, there is a temple arrangement, temple adapter or removable temple part with its corresponding microphone and speaker. The microphones again can be directional, one pointing generally outwards in a position close to the left ear, and one pointing generally outwards in a position close to the right ear. Alternatively, the microphones can point forward.

The microphone and the speaker close to an ear do not have to be in very close proximity to each other, as in many hearing aids existing nowadays. They can be spaced apart by, such as, one to several inches, with the microphone being directional and pointing to the front and to either the left or the right of the user, and with the speaker pointing toward or inserted into the corresponding ear of the user. Such a distance apart can significantly reduce feedback effect of existing hearing aids. Another advantage of such a hearing enhancement device is that users may not need to be fitted into ears with ear molds. In any case, additional details on hearing enhancement are further described in the related applications that have been incorporated herein by reference, such as U.S. Provisional Patent Application No. 60/620,238, filed Oct. 18, 2004, and entitled "EYEGLASSES WITH HEARING ENHANCED AND OTHER AUDIO SIGNAL-GENERATING CAPABILITIES."

The various embodiments of the invention noted above, whether temple arrangement, temple adapter or removable temple part, can have a cable or cord attached or attachable thereto. The cable or cord has one or more conductors. The cable or cord can serve to provide electrical signals to or receive electrical signals from the temple arrangement, the temple adapter or removable temple part. In one embodiment, one end of a cable or cord attaches to a temple arrangement, temple adapter or removable temple part (either permanently or via a connector) and the other end of the

cable or cord attaches (either permanently or via a connector) to an electronic device. As an example, the electronic device can be an audio output device (e.g., audio player) or a communication device (e.g., mobile telephone). In a first example, the cable or cord could provide a male audio (stereo) connector at one end, and a pair of female audio connectors at the opposite end, each being for use with a different temple. In a second example, the cable or cord could provide a set of connectors, such as a male mini-phone connector (2.5 mm) and a male audio (stereo) connector, at one end, and one or a pair of female phone connectors at the opposite end.

In one embodiment, the cable or cord can also have a switch coupled thereto so as to permit a user to switch modes. For example, if the temple arrangement, temple adapter or removable temple part provides a speaker and microphone to a pair of eyeglasses, a switch on a cable or cord that connects the temple arrangement or temple adapter to an electronic device could provide different switch positions for different electronic devices or different functional modes of operation of a single electronic device. As an example, if the electronic device is (or operates as) an audio player, a first switch position could be used. Alternatively, if the electronic device is (or operates as) a mobile telephone, a second switch position could be used. Additional discussion of suitable cables and cords is provided in the related applications that have been incorporated herein by reference.

Electrical components can form an electronic module. The electronic module can provide radiation monitoring, wireless communication, enhanced hearing, etc. A radiation monitoring system can be partially or fully contained in a temple arrangement, temple adapter or removable temple part associated with a temple of a pair of glasses. Typically, the temple arrangement or temple adapter can be removable from the temple. The removable temple part is obviously removable from a corresponding remaining temple part.

In another embodiment, an electronic component in a temple arrangement, temple adapter or removable temple part interacts with another electronic component in another part (e.g., frame) of the glasses or in a device tethered to the glasses. For example, a temple of a pair of glasses holds one portion of an electronic circuit. That portion can include generic parts, such as a battery, that are applicable to different applications. Another portion of the electronic circuit is in a temple arrangement, temple adapter or removable temple part. This portion can be application specific, such as an electronic clock without a battery, or a temperature sensor.

In yet another embodiment, the electrical components can provide audio player capabilities. In such an embodiment, the electrical components can include audio file storage, an audio player and a battery. The electrical components may or may not include wireless communication circuitry.

Further, in an alternative embodiment, the output of an operation indicator can be audio. The audio output can be from one or more speakers associated with the frame of the eyeglasses. Such audio output can signal the user using natural language, voice synthesis, pre-recorded messages, etc.

In another embodiment, the electrical components can include a memory module. The memory module provides non-volatile data storage. For example, the memory module can be a portable (or removable) memory device (e.g., memory card). The memory module can, for example, store sensor information (which can be over an extended period of time). Such memory module can be remotely interrogated

using wireless communication circuitry, or can be accessed through a wired connection with a tethered device.

In one embodiment, the electrical connection(s) can alternatively be used to allow information stored in the electrical components to be accessed or queried by a device. For example, when the electrical components include a memory module, the memory module can be accessed to read data (e.g., status information) stored therein.

As previously noted, the electrical components associated with a temple arrangement, a temple adapter and/or removable temple part can pertain to radiation monitoring circuitry. In such case, the electrical components within the temple arrangement, temple adapter or removable temple part alone or together with eyeglass electrical components can implement a radiation monitoring system. The radiation being monitored can, for example, pertain to one or more of UV, infrared and gamma radiation. In one embodiment, sunlight is considered as a type of radiation. In any case, additional details on radiation monitoring are further described in the related applications that have been incorporated herein by reference.

Also, the electrical components can pertain to health or fitness monitoring circuitry. In such case, the electrical components within the temple arrangement, the temple adapter removable temple part alone or together with eyeglass electrical components can implement a health or fitness monitoring system. Additional details on health or fitness monitoring are further described in the related applications that have been incorporated herein by reference.

In yet another embodiment, an electronic component in a temple arrangement, a temple adapter or removable temple part of a frame of eyeglasses interacts with an electronic component of an apparatus tethered to the eyeglasses to perform an operation. For example, a temple arrangement, a temple adapter removable temple part of a pair of eyeglasses holds one portion of an electronic system, and a tethered apparatus that tethers to the pair of eyeglasses includes another portion of the electronic system.

Still further, the invention can provide a new approach to marketing accessories, namely, electrical accessories, for eyewear. According to one method for providing temple arrangements, temple adapters and/or removable temple part for use with a pair of glasses, the method can initially provide a plurality of temple arrangements, temple adapters and/or removable temple part for a customer. This enables the customer to browse and select at least one temple arrangement, temple adapter or removable temple part. Each of the temple arrangements, temple adapters or removable temple part can have one or more electrical components at least partially embedded therein, with different temple arrangements, temple adapters or removable temple parts providing different electrical capabilities. Once a temple arrangement, temple adapter or removable temple part has been selected, the selected temple arrangement, temple adapter or removable temple part can be coupled to one of the corresponding temples of the eyewear (e.g., a pair of glasses). In the case where the selected temple arrangement is a temple tip, the selected temple tip is inserted onto (e.g., slid over) an end of the corresponding temple (after removing any previously installed temple tip if there was one). In the case where the selected temple adapter is to be coupled, the selected temple adapter can be attached to the corresponding temple. In the case where the selected removable temple part is to be coupled, the selected removable temple part can be attached to a remaining part (e.g., forward part) of the corresponding temple. Thereafter, the customer can make use of the eyewear with its associated electrical

capabilities provided by the temple arrangement, temple adapters or removable temple part.

In one embodiment, once a temple arrangement, a temple adapter and/or removable temple part is provided to a customer, the customer can test the electrical capabilities of the pair of glasses. If the customer does not like the current selected temple arrangement, temple adapter or removable temple part, the customer can repeat the process by selecting and testing another temple arrangement, temple adapter or removable temple part. Before providing the eyewear with the temple arrangement, temple adapter or removable temple part, the customer can be required to pay a purchase (or rental) price for at least the temple arrangement, temple adapter or removable temple part. Thereafter, the customer can be permitted to return and replace the temple arrangement, temple adapter or removable temple part with another temple arrangement, temple adapter or removable temple part. Such returns or replacements can be available only for a limited period of time following their purchase.

Yet still another aspect of the invention relates to eyewear having an extended endpiece so as to facilitate placement of one or more electrical components at the extended endpiece. In one embodiment, a conventional pair of glasses has two endpieces, one on its left and the other on its right side of the frame. For example, the left endpiece is the region of the frame approximately between the left hinge (or joint) and the left lens holder of the frame. Similarly, the right endpiece is the region of the frame approximately between the right hinge (or joint) and the right lens holder of the frame.

The one or more electrical components at an extended endpiece can operate independently or together with other electrical components provided elsewhere. For example, other electrical components can be provided in other regions of the frame for the eyewear. In another example, the other electrical components can be located in a bridge area of the frame for the eyewear. In such an example, given that the endpiece is extended, the one or more electrical components can be placed at the endpiece and thereby communicate with other electrical components in a front area (e.g., lens holder region or bridge region) or the other endpiece (which can also be extended) without having to communicate through a hinge or connector.

FIG. 11A illustrates a pair of glasses 1100 according to one embodiment of the invention. The pair of glasses 1100 includes a first lens holder 1102 and a second lens holder 1104. The lens holders 1102 and 1104 are capable of receiving lenses. The lenses can be prescription lenses or non-prescription lenses. The first lens holder 1102 has a first side and a second side. The second lens holder 1104 has a first side and a second side. The pair of glasses 1100 also has a bridge 1106 in between the first lens holder 1102 and the second lens holder 1104. The bridge 1106 is coupled to the second side of the first lens holder 1102 and the first side of the second lens holder 1104. The lens holders 1102 and 1104 and the bridge 1106 can be separate pieces or a single integral piece. The glasses 1100 can also be referred to as eyeglasses.

The pair of glasses 1100 also includes a first extended endpiece 1112 and a second extended endpiece 1113. In addition, the pair of glasses 1100 includes a pair of temples, namely, a first temple 1108 and a second temple 1110. The first extended endpiece 1112 connects to the first temple 1108 via a joint (or hinge) 1114. The second extended endpiece 1113 connects to the second temple 1110 via a joint (or hinge) 1115. In one embodiment, the extended endpieces 1112 and 1113 are larger as compared to conventional endpieces. As a result, the respective joints (or hinges) 1114

and 1115 are set back from the respective lens holders 1102 and 1104. For example, in one embodiment, the hinge 1115 is set back from the lens holder 1104 by about 1 to 5 centimeters. One advantage of utilizing enlarged (or extended) endpieces 1112 and 1113 as illustrated in FIG. 11A is that electrical components 1116 are able to be comfortably provided in the extended endpieces 1112 and 1113. Moreover, another advantage is that the electrical components 1116 within the extended endpiece 1113 can electrically couple to other electrical components provided within the forward portion or front area of the frame without having to electrically connect through a joint or hinge. As illustrated in FIG. 11A, the extended endpiece 1113 provides electrical components 1116 with at least a portion at an inner surface of the extended endpiece 1113. The electrical components 1116, in this example, include a display 1118 and a plurality of switches 1120 (e.g., buttons). As an example, the electrical components 1116 can, for example, implement an electrical system (e.g., pedometer system, UV monitoring system, or other physical condition monitoring system, etc.). In the embodiment of the glasses 1100 illustrated in FIG. 11A, the electrical components 1116 are provided in the extended endpiece 1113.

FIG. 11B illustrates the pair of glasses 1100 according to another embodiment of the invention. More particularly, FIG. 11B illustrates the pair of glasses 1100 illustrated in FIG. 11A where the electrical components 1116 are provided as a module 1122 embedded internal to the extended endpiece 1113. The module 1122 includes a plurality of interconnected electrical components, including the display 1118 and the switches 1120. In addition, the glasses 1100 further include a separate electrical component 1124. As illustrated in FIG. 11B, the separate electrical component 1124 can be provided at the bridge 1106. Still further, a conductive element (e.g., a wire) that electrically connects the module 1122 with the separate electrical component 1124 can be provided internal to the eyeglass frame, such as internal to the lens holder of 1104. The nature of the separate electrical component 1124 can vary depending upon application. In the case in which the module 1122 pertains to a pedometer or health system, the separate electrical component 1124 can pertain to a sensor used to measure the heart rate of the user of the glasses 1100. For additional details on a sensor utilized in this context, see U.S. Provisional Patent Application No. 60/787,850, filed Apr. 1, 2006, and entitled "EYEGASSES WITH HEART RATE MONITOR," which is hereby incorporated herein by reference. Although not illustrated in FIG. 11B, the extended end piece 1113 can also include a cavity (or opening) and a cover or a door. The module 1122 can be inserted or removed from the cavity by way of the cover or door.

FIGS. 12A-12E illustrate a side view of eyeglass frames having an extended endpieces according to several embodiment of the invention. In FIG. 12A, a side view of an eyeglass frame 1200 includes a lens holder (or a region immediately proximate to a lens holder) 1202, an extended endpiece 1204 and a temple 1206. The extended endpiece 1204 includes one or more electrical components 1208 partially or completely internal to the extended endpiece 1204. In this embodiment, the manner by which the temple 1206 connects to the extended endpiece 1204 is not depicted. Hence, the temple 1206 can be integral with the extended endpiece 1200, can be permanently coupled to the extended endpiece 1204, or can be removably or pivotally coupled to the extended endpiece 1204.

The side view of an eyeglass frame 1220 illustrated in FIG. 12B is similar to the eyeglass frame 1200 illustrated in

FIG. 12A. However, in this embodiment, the temple 1206 is coupled to the extended endpiece 1204 by way of a joint (or hinge) 1210. FIG. 12C illustrates the eyeglass frame 1220 with the temple 1206 being substantially closed with respect to the eyeglass frame 1220. As noted in FIG. 12C, the temple 1206 can rotate (or pivot) with respect to the extended endpiece 1204 by way of the joint (or hinge) 1210. In this embodiment, the temple 1206 is able to be rotated (or pivoted) as in conventional eyewear such that (i) the temples can be closed or folded inwards towards the lens holders when not being worn, which can facilitate storage or (ii) the temples can be extended to an open position or extended outwards away from the lens holders, so that the eyeglasses can be worn. While retaining the traditional notion of the folding temples, the eyeglass frame 1220 causes the joint 1210 to be set back from the lens holder 1202 so that the endpiece is extended, which can facilitate including or storing one or more electrical components within the endpiece.

The side view of an eyeglass frame 1230 illustrated in FIG. 12D is similar to the eyeglass frame 1200 illustrated in FIG. 12A. However, in this embodiment, the temple 1206 is coupled to the extended endpiece 1204 by a linking temple piece 1232. The linking temple piece 1232 couples to the extended endpiece 1204 by way of a joint (or hinge) 1234. The joint 1234 allows the linking temple piece 1232 to rotate (or pivot) with respect to the extended endpiece 1204. In addition, the linking temple piece 1232 includes a connector 1236 that is capable of receiving a corresponding connector 1238 associated with the temple 1206. In this embodiment, the temple 1206 couples to the linking temple piece 1232 using the connectors 1236 and 1238 which provide physical connection (and optionally also electrical connection). The linking temple piece 1232 in turn can couple to the extended endpiece 1204 by way of the joint (or hinge) 1234. The temple 1206 is thus easily removable from the linking temple piece 1232 of the eyeglass frame 1230.

The side view of an eyeglass frame 1240 illustrated in FIG. 12E is similar to the eyeglass frame 1200 illustrated in FIG. 12A. However, in this embodiment, the extended endpiece 1204 includes a first connector 1242, and the temple 1206 includes a corresponding connector 1244. Here, the temple 1206 can be removably connected to the extended endpiece 1204 by way of the connectors 1242 and 1244.

According to still another embodiment of the invention, temples for eyeglass frames can be not only removable but also piecewise replaceable. In other words, an entire temple can be removed and replaced with respect to an eyeglass frame. In another implementation, a portion of a temple can be removed and replaced with another portion. Allowing temples of eyeglass frames to be removed and replaced facilitates incorporating different electronic modules that are internal to, integral with, or at least partially embedded in the temples (or temple portions) to be changed. Also, the different temple portions can have different design appearances that allow the design of the eyeglasses, namely the temples, to be altered as desired by a user. In other words, the temples or temple portions can be swappable.

FIG. 13A illustrates a temple 1400 having multiple parts according to one embodiment of the invention. The temple 1400 includes a temple base 1402 that couples to a forward portion 1404 of an eyeglass frame. The forward portion 1404 can, for example, pertain to an endpiece or a portion in the vicinity of a hinge (or joint) of a temple. In addition, the temple 1400 includes a temple tip 1406 (or rearward portion). One end of the temple base 1402 can connect to the

forward portion **1404** and the other end of the temple base can connect to the temple tip (or rearward portion) **1406**. In one embodiment, the temple base **1402** and the temple tip **1406** of an eyeglass frame can be replaced (individually or in combination) with other temple bases and temple tips. For example, the temple base **1402** and/or the temple tip **1406** could be removed and replaced with another temple base and/or temple tip having a different functional capability or a different ornamental appearance.

FIG. **13B** illustrates a portion of an eyeglass frame **1420** according to one embodiment of the invention. The portion of the eyeglass frame **1420** is similar to a portion of the eyeglass frames **1200** illustrated in FIG. **12A**. One difference is that the temple **1206** now explicitly illustrates a temple base **1422** and a temple tip **1424**. The temple base **1422** and the temple tip **1424** can be removed and replaced (individually or in combination) with respect to the eyeglass frame, such as the extended endpiece **1204**.

FIG. **13C** illustrates a portion of an eyeglass frame **1340** according to another embodiment of the invention. The portion of the eyeglass frame **1440** is similar to a portion of the eyeglass frame **1200** illustrated in FIG. **12A**. However, in FIG. **13C**, the portion of the eyeglass frame **1440** includes a temple insert **1442**. The temple insert **1442** can include one or more electrical components **1444** internal to, integral with, or at least partially embedded in the temple insert **1442**. As illustrated in FIG. **13C**, the temple insert **1442** can be provided between the extended endpiece **1204** and the temple **1206** or the rearward portion of the temple. Although not shown in FIG. **13C**, the connection between the temple insert **1442** and the extended endpiece **1204** or the temple **1206** can be through use of a joint (or hinge) or by way of connectors as discussed above. In this embodiment, the temple insert **1442** can provide electrical components that can interact with the electrical components **1208** within the extended endpiece **1204** or elsewhere within the eyeglass frame. Hence, a user can optionally include the temple insert **1442** between the temple **1206** and the extended endpiece **1204** to provide additional functionality to the eyeglasses. In one embodiment, when the additional functionalities are not desired, the temple insert **1442** can be removed from the temple configuration, or the one or more electrical components **1444** can be removed from the temple insert **1442**.

The eyewear can contain lenses, either vision corrective lenses or non-corrective lenses. Examples of eyewear using corrective lenses include, for example, prescription glasses, bi-focal glasses, reading glasses, driving glasses, and progressive glasses. Examples of eyewear, using corrective or non-corrective lenses, are sunglasses, fit-over glasses, safety glasses, sports glasses, swim masks or goggles and ski goggles. The eyewear can also include wrap-around glasses (with wrap-around lenses), fit-over glasses, or auxiliary frames (which attach to existing frames). Still further, the eyewear can include a strap for glasses, such as a strap to hold glasses on one's head. The strap can include some or all of the components for monitoring radiation, such components can be attached or at least partially embedded in the strap.

The various aspects, embodiments, implementations and features of the invention noted above can be combined in various ways or used separately. Those skilled in the art will understand from the description that the invention can be equally applied to or used in other various different settings with respect to various combinations, aspects, embodiments, implementations or features provided in the description herein.

Certain aspects of the invention can be implemented in software, hardware or a combination of hardware and software. Certain aspects of the invention can also be embodied as computer readable code on a computer readable medium. The computer readable medium is any data storage device that can store data which can thereafter be read by a computer system. Examples of the computer readable medium include read-only memory, random-access memory, CD-ROMs, magnetic tape, optical data storage devices, and carrier waves. The computer readable medium can also be distributed over network-coupled computer systems so that the computer readable code is stored and executed in a distributed fashion.

The advantages of the invention are numerous. Different embodiments or implementations may yield one or more of the following advantages. One advantage of the invention is that electrical components can be provided integral with or attached to a temple arrangement, a temple adapter or a removable temple part for use with a pair of eyeglasses. Another advantage of the invention is that after-market changes to electrical capabilities of eyeglasses can be relatively easily achieved. Another advantage of the invention is that communication, computation, information capturing or sensing, and/or operational capabilities can be provided for eyeglasses without substantial interference to style or design choices of the glasses. Still another advantage of the invention is that wireless communications, radiation monitoring, fitness monitoring and/or health monitoring can be supported by the electrical components. Yet another advantage of the invention is the ability to provide hands-free wireless communications capability.

Numerous specific details are set forth in order to provide a thorough understanding of the present invention. However, it will become obvious to those skilled in the art that the invention may be practiced without these specific details. The description and representation herein are the common meanings used by those experienced or skilled in the art to most effectively convey the substance of their work to others skilled in the art. In other instances, well-known methods, procedures, components, and circuitry have not been described in detail to avoid unnecessarily obscuring aspects of the present invention.

In the foregoing description, reference to "one embodiment" or "an embodiment" means that a particular feature, structure, or characteristic described in connection with the embodiment can be included in at least one embodiment of the invention. The appearances of the phrase "in one embodiment" in various places in the specification are not necessarily all referring to the same embodiment, nor are separate or alternative embodiments mutually exclusive of other embodiments. Further, the order of blocks in process flowcharts or diagrams representing one or more embodiments of the invention do not inherently indicate any particular order nor imply any limitations in the invention.

Many features and advantages of the present invention are apparent from the written description. Since numerous modifications and changes will readily occur to those skilled in the art, it is not desired to limit the invention to the exact construction and operation as illustrated and described. Hence, all suitable modifications and equivalents may be resorted to as falling within the scope of the invention.

What is claimed is:

1. Eyewear, comprising:

an eyewear frame having a front section and first and second extended endpieces, the first and second extended endpieces being provided at opposite sides of the front section of the eyewear frame, the first

31

extended endpiece being adjacent a first side of the front section, and the second extended endpiece being adjacent a second side of the front section;

a first integrated circuit provided internal to the first extended endpiece of the eyewear frame;

a second integrated circuit provided internal to the second extended endpiece of the eyewear frame;

a first radiation detector at least partially internal to the first extended endpiece or the front section of the eyewear frame;

a second radiation detector at least partially internal to the second extended endpiece or the front section of the eyewear frame; and

a third integrated circuit provided internal to the front section of the eyewear frame.

2. Eyewear as recited in claim 1, wherein the third integrated circuit being operatively connected to the first integrated circuit and the second integrated circuit.

3. Eyewear as recited in claim 1, wherein the third integrated circuit being operatively connected to the first radiation detector and the second radiation detector.

4. Eyewear as recited in claim 1, wherein the third integrated circuit being operatively connected to the first radiation detector and the second radiation detector.

5. Eyewear as recited in claim 1, wherein the front section of the eyewear frame includes one or more lens holders to hold one or more lens, the one or more lens permit a user whom wears the eyewear to view its physical environment through the one or more lens.

6. Eyewear as recited in claim 1, wherein the eyewear comprises:

- a microphone; and
- an audio output device,

wherein the microphone and the audio output device are each at least partially embedded in the eyewear.

7. Eyewear as recited in claim 1, wherein a portion of the first extended endpiece is attached or adjacent to a first end of the front section, and wherein a portion of the second extended endpiece is attached or adjacent to a second end of the front section, the first and second ends of the front section being at opposite ends of the front section.

8. Eyewear as recited in claim 1, wherein a forward portion of the first extended endpiece is provided in the plane of the front section, and wherein a forward portion of the second extended endpiece is provided in the plane of the front section.

9. Eyewear as recited in claim 8, wherein a portion of the first extended endpiece is attached or adjacent to a first end of the front section, and wherein a portion of the second extended endpiece is attached or adjacent to a second end of the front section, the first and second ends of the front section being at opposite ends of the front section.

10. Eyewear, comprising:

- an eyewear frame having a front section and first and second extended endpieces, the first and second extended endpieces being provided at opposite sides of the front section of the eyewear frame, the first extended endpiece being adjacent a first side of the front section, and the second extended endpiece being adjacent a second side of the front section;
- a first integrated circuit provided internal to the first extended endpiece of the eyewear frame;
- a second integrated circuit provided internal to the second extended endpiece of the eyewear frame;

32

- a first radiation detector at least partially internal to the first extended endpiece or the front section of the eyewear frame;
- a second radiation detector at least partially internal to the second extended endpiece or the front section of the eyewear frame; and
- a third integrated circuit provided internal to the eyewear frame and operatively connected to at least the first integrated circuit or the second integrated circuit.

11. Eyewear as recited in claim 10, wherein the first radiation detector and the second radiation detector detect infrared radiation.

12. Eyewear as recited in claim 11, wherein the first radiation detector is configured to sense at least incident light.

13. Eyewear as recited in claim 10, wherein the eyewear comprises:

- a detector at least partially internal to the front section, the first extended endpiece or the second extended endpiece.

14. Eyewear as recited in claim 10, wherein the eyewear comprises:

- a detector at least partially internal to a bridge region of the front section,

wherein the front section of the eyewear frame includes an opening and the detector is provided at least partially internal to the front section but adjacent the opening so as to be visually exposed to an environment of the eyewear.

15. Eyewear as recited in claim 10, wherein the eyewear comprises:

- at least one radiation emitter to direct radiation energy towards a portion of a user's head when the eyewear is being worn by the user.

16. Eyewear as recited in claim 10, wherein the eyewear comprises:

- a microphone; and
- an audio output device,

wherein the microphone and the audio output device are each at least partially embedded in the eyewear.

17. Eyewear as recited in claim 16,

wherein the eyewear frame includes a first side section and a second side section, the first side section is operatively coupled to the first extended endpiece, and the second side section is operatively coupled to the second extended endpiece, and

wherein the audio output device includes a first speaker and a second speaker, the first speaker being at least partially internal to the first side section, and the second speaker being at least partially internal to the second side section.

18. Eyewear as recited in claim 10, wherein a portion of the first extended endpiece is attached or adjacent to a first end of the front section, and wherein a portion of the second extended endpiece is attached or adjacent to a second end of the front section, the first and second ends of the front section being at opposite ends of the front section.

19. Eyewear as recited in claim 10, wherein a forward portion of the first extended endpiece is provided in the plane of the front section, and wherein a forward portion of the second extended endpiece is provided in the plane of the front section.

20. Eyewear as recited in claim 19, wherein the forward portion of the first extended endpiece is attached or adjacent to a first end of the front section, and wherein the forward portion of the second extended endpiece is attached or

33

adjacent to a second end of the front section, the first and second ends of the front section being at opposite ends of the front section.

21. Eyewear as recited in claim 10, wherein the eyewear comprises:

a visual indicator configured to signal, to a person, information concerning at least an operational status pertaining to an electrical component of the eyewear.

22. Eyewear as recited in claim 21, wherein the eyewear comprises:

at least one radiation emitter to direct radiation energy towards a portion of a user's head when the eyewear is being worn by the user.

23. Eyewear as recited in claim 10, wherein the eyewear comprises a magnetically-assisted switch for providing electrical connection.

24. Eyewear as recited in claim 10, wherein the eyewear is a goggle.

25. Eyewear as recited in claim 24, wherein the goggle comprises a battery, wherein the goggle comprises:

a charging circuit electrically connected to the battery, the charging circuit being embedded in the goggle; and wherein the goggle further comprises a connector port that is electrically connected with the charging circuit, the connector port being at least partially embedded in the goggle.

26. Eyewear as recited in claim 25, wherein the battery is configured to be charged via the connector port., and wherein the goggle comprises a magnetically-assisted switch for providing electrical connection with the connection port.

27. Eyewear, comprising:

an eyewear frame having a front section and first and second extended endpieces, the first and second extended endpieces being provided at opposite sides of the front section of the eyewear frame, the first extended endpiece being adjacent a first side of the front section, and the second extended endpiece being adjacent a second side of the front section;

a first integrated circuit provided internal to the first extended endpiece of the eyewear frame;

a second integrated circuit provided internal to the second extended endpiece of the eyewear frame;

a first light sensing device at least partially internal to the first extended endpiece or the front section of the eyewear frame;

a second light sensing device at least partially internal to the second extended endpiece or the front section of the eyewear frame; and

a third integrated circuit provided internal to the eyewear frame and operatively connected to at least the first integrated circuit or the second integrated circuit.

28. Eyewear as recited in claim 27, wherein the first light sensing device and the second light sensing device detect light energy.

29. Eyewear as recited in claim 28, wherein the eyewear further comprises a radiation detector,

wherein the radiation detector is configured to sense an attribute of a user of the eyewear, and

wherein the radiation detector is directed towards a portion of the head of the user when the eyewear is being worn by the user.

30. Eyewear as recited in claim 29, wherein the eyewear comprises:

34

at least one radiation emitter to direct radiation energy towards a portion of a user's head when the eyewear is being worn by the user; and

wherein the radiation detector is configured to sense at least a portion of the radiation energy that is reflected from the portion of the user's head when the eyewear is being worn by the user.

31. Eyewear as recited in claim 27, wherein the eyewear comprises:

a detector at least partially internal to the front section, wherein the front section of the eyewear frame includes an opening and the detector is provided at least partially internal to the front section but adjacent the opening so as to be visually exposed external to the eyewear.

32. Eyewear as recited in claim 31, wherein the eyewear comprises:

at least one radiation emitter to direct radiation energy towards a portion of a user's head when the eyewear is being worn by the user; and

wherein the detector is configured to sense at least a portion of the radiation energy that is reflected from the portion of the user's head when the eyewear is being worn by the user.

33. Eyewear as recited in claim 27, wherein the eyewear comprises:

a microphone; and an audio output device, wherein the microphone and the audio output device are each at least partially embedded in the eyewear.

34. Eyewear as recited in claim 33, wherein the eyewear frame includes a first side section and a second side section, the first side section is operatively coupled to the first extended endpiece, and the second side section is operatively coupled to the second extended endpiece, and

wherein the audio output device includes a first speaker and a second speaker, the first speaker being at least partially internal to the first side section, and the second speaker being at least partially internal to the second side section.

35. Eyewear as recited in claim 34, wherein the eyewear comprises:

a visual indicator configured to signal, to a person, information concerning at least an operational status pertaining to an electrical component of the eyewear.

36. Eyewear as recited in claim 35, wherein the eyewear comprises a magnetically-assisted switch for providing electrical connection.

37. Eyewear as recited in claim 34, wherein the front section of the eyewear frame includes one or more lens holders to hold one or more lens, the one or more lens permit a user whom wears the eyewear to view a visual environment through the one or more lens.

38. Eyewear as recited in claim 34, wherein a forward portion of the first extended endpiece is provided in the plane of the front section, and wherein a forward portion of the second extended endpiece is provided in the plane of the front section.

39. Eyewear as recited in claim 38, wherein the forward portion of the first extended endpiece is attached or adjacent to a first end of the front section, and wherein the forward portion of the second extended endpiece is attached or adjacent to a second end of the front section, the first and second ends of the front section being at opposite ends of the front section.

40. Eyewear as recited in claim 34, wherein the eyewear further comprises a radiation detector,

35

wherein the radiation detector is configured to sense an attribute of a user of the eyewear, and wherein the radiation detector is directed towards a portion of the head of the user when the eyewear is being worn by the user.

41. Eyewear as recited in claim 40, wherein the eyewear comprises:

at least one radiation emitter to direct radiation energy towards a portion of a user's head when the eyewear is being worn by the user; and

wherein the radiation detector is configured to sense at least a portion of the radiation energy that is reflected from the portion of the user's head when the eyewear is being worn by the user.

42. Eyewear as recited in claim 41, wherein the eyewear comprises:

a visual indicator configured to signal, to a person, information concerning at least an operational status pertaining to an electrical component of the eyewear.

43. Eyewear as recited in claim 42, wherein the eyewear comprises a magnetically-assisted switch for providing electrical connection.

44. Eyewear as recited in claim 27, wherein a portion of the first extended endpiece is attached or adjacent to a first end of the front section, and wherein a portion of the second

36

extended endpiece is attached or adjacent to a second end of the front section, the first and second ends of the front section being at opposite ends of the front section.

45. Eyewear as recited in claim 27, wherein a forward portion of the first extended endpiece is provided in the plane of the front section, and wherein a forward portion of the second extended endpiece is provided in the plane of the front section.

46. Eyewear as recited in claim 45, wherein the forward portion of the first extended endpiece is attached or adjacent to a first end of the front section, and wherein the forward portion of the second extended endpiece is attached or adjacent to a second end of the front section, the first and second ends of the front section being at opposite ends of the front section.

47. Eyewear as recited in claim 27, wherein the eyewear comprises:

a visual indicator configured to signal, to a person, information concerning at least an operational status pertaining to an electrical component of the eyewear.

48. Eyewear as recited in claim 27, wherein the eyewear comprises a magnetically-assisted switch for providing electrical connection.
